

Object Types Overview

Last Modified on 08/14/2024 9:44 am EDT

Overview

Object types are the containers for the data entered into Resolver and are the foundation of the entire system.

Object types determine the category of data that's collected and exactly what kind of data is entered. After an object type has been created, it can be associated with [configurable forms](#), [applications](#), activities, tasks, and [data visualizations](#). Records saved within an object type are known as objects.

Administrators define what appears on the object type by adding [fields](#), [relationships](#), [formulas](#), and [roles](#), which are [components](#). Components need to be added so they can later be selected to appear on the configurable forms created for the object type, alongside the object's [properties](#). If needed, these components can be used to create [concatenations](#) that use custom expressions to auto-populate the Name and Description properties on an object.

The data collection process for each object type is defined through a [workflow](#), while the privileges a user has when working with the object type is specific in their role's [workflow permissions](#).

User Account Requirements

The user must have Administrator permissions in order to access the ***Admin Overview*** screen.

Required Information/Setup

For more information on adding and using object types, please refer to the [Object Types](#) section.

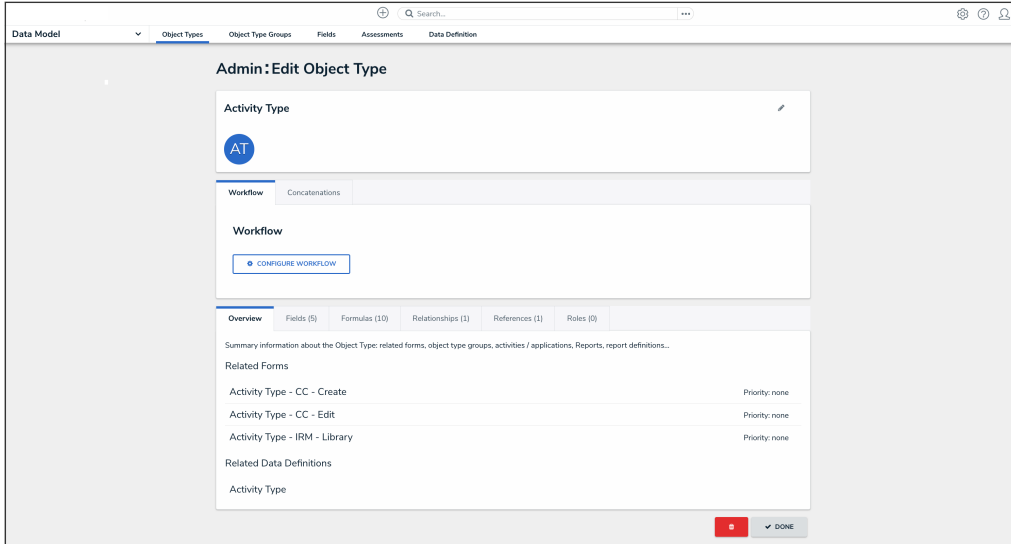

Admin: Edit Object Type Screen

Components and workflows are configured through the ***Admin: Edit Object Type*** screen, which has a number of tabs with information and configurable settings, including:

- **Overview:** A list of any [configurable forms](#) or [data definitions](#) associated with the object type.
- **Fields:** Allows you to create, add, and edit [fields](#) on the object type as well as displays a list of the previously added fields.
- **Formulas:** Allows you to create, add, and edit [formulas](#) on the object type as well as displays a list of the previously added formulas.
- **Relationships:** Allows you to create, add, and edit [relationships](#) on the object type as

well as displays a list of the previously added relationships.

- **References:** Displays a list of [references](#) on the object type.
- **Roles:** Allows you to add and configure [roles](#) on the object type as well as displays a list of the previously added roles.
