

Configurable Forms Overview

Configurable forms are the forms that administrators create and customize for users to enter or view data while working in Core. Form types include:

- **Standard Form:** Allows administrators to specify what form elements are displayed and the fields users should fill out on object types as they work in [activities](#), [reports](#), or [tasks](#), depending on the current state of the object's [workflow](#). For more information, see the [Standard Form Overview](#) article.
- **Navigation Form:** Uses a data definition to display objects as a hierarchical tree with expandable nodes, starting with the object from the anchor object type and moving down the data path. Clicking one of these objects will display a standard form or report to the right of the tree, without leaving the navigation form. For more information, see the [Navigation Form Overview](#) article.
