

Data Visualizations Overview

The **Data Visualizations** feature allows you display or export object data through a **report**, **data grid**, or **export report**. All data visualizations require a [focus eligible](#) data definition and one more or more [data series](#) (for reports and data grids).

Once a data visualization has been added to an application, end users can perform a variety of actions, including [starring](#) reports, applying filters, and editing or exporting data.

See the [Reports](#) , [Data Grid](#) , or [Data Analytics Export](#) sections for more information on each data visualization type.
