

Version 2.2.1 (Hotfix) Release Notes

Last Modified on 08/21/2018 3:37 pm EDT

This hotfix release includes a number of performance enhancements to improve your overall experience in Resolver Core. These enhancements include:

- New variable sub-types to improve formula processing.
 - Variables can now be made to contain the actual Array (default for current formulas), Count, Every, Average, Max, and Min values of a relationship or reference field (instead of representing the list of values). This means that formula variables can be used to collect and hold information, thereby greatly improving performance when formulas are recalculated.
- Other general performance improvements for:
 - Reports
 - Search
 - Scope & Launch
 - Object creation
