

Manually Deleting an Object

Last Modified on 07/31/2024 2:54 pm EDT

Note:

If you want to take advantage of the Data Retention feature, Administrators must first contact Support to enable the feature.

Overview

When using the Data Retention function, users will have the ability to fully delete (purge) mistakes or test objects within the system without retaining the data that may interfere with analytics data accuracy.

When an object is deleted, it will go into a purge queue. The object is removed from the UI and cannot be reverted.

When an object is deleted, the audit trail is updated to ensure that only records identified as being retained for analytics remain.

Warning:

When an object is deleted, it no longer exists and cannot be reverted. Specific object data can be retained for analytical purposes and must be setup on the object type.

User Account Requirements

A user must be a part of an org that has the Data Retention function activated and object type delete permissions in order to delete an object from the system.

Navigation

There are many ways to access objects within the system. For this illustration, we will be accessing an object through the *My Tasks* section on the *Home* screen.

• From the *Home* screen, click on an **Object** on the *My Tasks* section.

Object

Manually Deleting an Object

1. From the *Corrective Action (Object)* screen, click the More Actions icon.

Delete Button

- 10. When an object is deleted, the audit trail is updated to ensure that only records identified as retainable for analytics remain and all other audit events are deleted.
- 11. The following occurs in the Audit Trail when an object is deleted:
 - All records are removed except for Create Object records.
 - The deleted object name is redacted.
 - A final Delete Object entry is made with the object name redacted.
